Multidisciplinary Comprehensive Care for Early Recommencement of Oral Intake in Older Adults With Severe Pneumonia

Comprehensive geriatric assessment by a team of specialized nurses, dental hygienists, occupational therapists, speech-language pathologists, physiotherapists, and registered dietitians was shown to promote early resumption of oral intake and shorten hospital length of stay.

Prevalence of Erectile Dysfunction and Associated Factors in Korean Older Adults With Coronary Artery Disease

Health-related quality of life was lower in these patients, indicating the need for health care providers to focus on improving caregivers' knowledge and communication skills with patients and spouses regarding sexual health.

Critical Association Between Mental Health Disorders and Medical Status: Depression Intervention Use Indicates a Two-Fold Risk for Subsequent Medical Events in Older American Home Health Care Patients

Individuals receiving depression intervention had the greatest risk for all-cause emergency department use and 30- and 60-day acute care hospitalization in a national sample of U.S. older adult home health care patients.
